

Securing your DATA

Data backup, something a lot of companies feel it's important and never realize how important until it's too late. According to Gartner research there is a 70% failure rate of tape backup media. 70% is a HUGE amount to risk. Let's get out of technical statics and into something we can wrap our minds around. 8 Track tapes, Cassette tapes do you remember these? These use the same film as does the tape backup media you trust your businesses critical data on. Now lets get a little deeper, someone accidental clicks too far and delete or overwrites something critical, you can do a timely restore with your tapes. Just need to take that few hours out of the day for that one document.

The newer generations of backup is online, and off site. Secured and encrypted, with these new services, that take minutes to restore files and that can email logs to you with a report EVERYDAY! These are cost effective, and can help any business stay on track and be more productive.

In conclusion, go try out those 8 tracks that you have buried somewhere in a closet and see how well they work, then when you get to work find a solution that can make your company save money and become more productive. Hey maybe your boss will give you a raise after your server crashes and you get the company back online quickly. Hey it could happen!
